POWDER METALLURGY

THINK > Materials and Processes

GKN Sinter Metals Material Lists

GKN Sinter Metals offers the broadest material selection in the industry to meet a wide range of needs.

GKN´s powder metal (PM) material capabilities not even match with traditional material types, it rather excels them due to the fact that PM allows for unique material combinations that cannot be produced with the traditional iron melting furnace process.

That is why the GKN PM technology offers unique product solutions and benefits for diverse markets from Automotive, Medical, Aerospace, Industrial to Consumer product applications!

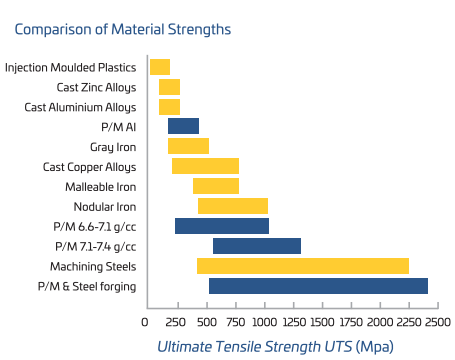
The following graph shows the comparison of ultimate tensile strengths of PM grades compared to traditional materials types.

As full metal shape solution provider we find the best technology fit to get the optimum value for your product solution. Below graphic shows available material structure types.

MATERIAL		POWDER METALLURGY (PM) PROCESS TECHNOLOGY				
Classification	Description	Conventional	Forged	MIM *	Filters	Bearings
Iron & Steel	Iron	■	■			■
	Plain Carbon Steel	■	■	■		
	Structural Alloy Steel (Cu, Ni, Mo, Mn, Cr) **	■	■	■		
	Specialized Alloy Steel **	■		■		
Stainless Steel	Austenitic	■		■	■	
	Ferritic	■		■	■	
	Martensitic	■		■	■	
	Precipitation Hardening			■	■	
Ferrous Soft Magnetic	Iron	■		■		
	Alloyed Iron	■		■		
	(P, Si, and Ni) **	■				
Copper-Based	Copper	■				
	Brass	■			■	
	Bronze	■			■	■
	Diluted Bronze					■
Aluminum Alloys ***	Standard Series (PM2014, 6061, 7075; PM-AL-145I	■				
	Thermal Series (TC-2000)	■				
	Mechanical Strength Series (MMC-1)	■				

* Metal Injection Molding)
** Several PM alloying methods are utilized: elemental blends, diffusion bonded, fully alloyed, or combinations of these.
*** Various alloys are available including 2024 (Al-Cu-Mg-Si), 6061 (Al-Mg-Si-Cu)and 7075 (Al-Zn-Cu-Mg) plus Metal Matrix Composite (MMC) variants.

PM Material strengths



GKN supports customers with the best material selction in order to achieve maximum product performances.

Find an overview of the wide performance range of our PM grades and densities values.

[1] In addition to the elements mentioned, further alloying elements up to 2 % are admitted.
[2] Sizing will reduce the elongation.
[3] Bending load. 2 x 10^6 cycles, notch factor α_k = 1.0 (ref. 30912 Part 6); R= -1.
[4] Austenitized at 900 °C, 60 minutes – oil quenched; tempered at 180 - 220 °C, 60 minutes, air.
[5] Sinterhardening is performed in the sinter furnace by gas quenching subsequently to the sintering process. Materials can be tempered as well at 160 °C – 240 °C for 30 min – 120 min due to requirements.
[6] High temperature sintering (HT) is performed at 1,200 °C – 1,300 °C depending on furnace type.
[7] FEL available for 3 point bending stress

[1] In addition to the elements mentioned, further alloying elements up to 2 % are admitted.
[2] Case hardening or carbo-nitriding is perfomed depending on the required case depth and is in general followed by a stress relief operation as well.
[3] The surface density can be exactly determined by metallographic investigations combined with quantitative image analysis.
[4] The indicated surface hardness is determined after the surface densification but prior to a potential heat treatment. The increased hardness at the surface can be explained by work hardening due to the deformation of the material during the densification step.

[1] In addition to the elements mentioned, further alloying elements up to 2 % are admitted.
[2] Sizing will reduce the elongation.
[3] Bending load. 2 x 10^6 cycles, notch factor α_k = 1.0 (ref. 30912 Part 6); R = -1.
[4] Case hardening or carbo-nitriding is perfomed depending on the required case depth and is in general followed by a stress relief operation as well.
[5] Carbon content shall be as specified by the purchaser. Unless agreed upon between the purchaser and manufacturer, the forged product carbon content s be within +/- 0.1% of the specified carbon content.
[6] For FEL, polished specimen and R = 0.1. Runout 1 x 107 cycles. Other fatigue information available on request.
[7] Details on request.

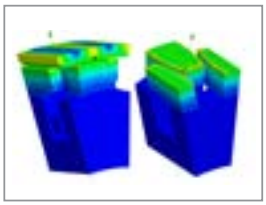
Engineering & PM Metal Shaping Capabilities

GKN offers unique engineering support and a wide range of PM Metal shaping processes which enables to find the best product solution in value and performance for our customers. Our product solutions benefit all kind of markets from automotive, medical, aerospace, industrial to consumer products.

ENGINEERING

- GKN's competence in engineering and design for best possible customer satisfaction
- ~ 550 highly qualified engineers and designers



SIMULATION

- Structural mechanic simulation and system design
- Thermal simulation
- Electromagnetic simulation

DESIGN FOR PM

- Benefit from reduced total-cost-of-ownership (TCO) through GKN's development experience and support
- Technology-oriented design for cost efficient production
- Reduced development periods
- Added value due to integrated functionality

METROLOGY

- B-H field meter
- Coercimeter
- Resistance test

MATERIALS & ENGINE TEST BENCHES

- In-house materials test center for tensile testing, service life tests, elevated temperature testing, tribological testing
- In-house variable engine test bench for performance tests, long-run performance, thermal performance

CONVENTIONAL PM

Improvements in materials and processes has resulted in a new class of high performance, consistent, competitive and creative products.

ALUMINIUM PM

Providing engineers with a new tool for weight reduction and improved product performance, GKN is taking PM Aluminium to a new level by leveraging unique materials capabilities not possible with competing technologies.

SOFT MAGNETIC PM

Enables engineers to develop smaller products with improved performance for electric motors and electromechanical systems.

SURFACE DENSIFIED PM

This technology enables GKN to deliver gears that combine the net shape advantages of PM technology with the performance of wrought steel.

POROUS METAL FILTERS

These filters and compnents are based on GKN´s controlled porosity materials for demanding applications where traditional filters are unable to deliver.

METAL INJECTION MOLDING (MIM)

MIM is 3D shape capability of plastic injection molding combined with the performance of alloy steels, stainless steels and high temperature alloys.

STAINLESS STEEL PM

Excellent choice for optimum corrosion resistance in high demand applications.

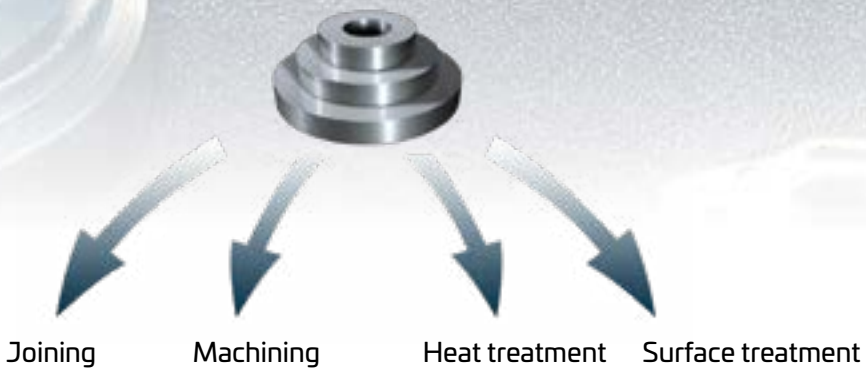
FORGED PM

This process step creates a nearly full dense part with high dynamic loads by utilizing a closed die which creates high axial precision.

ADDITIVE MANUFACTURING

In a competitive environment, speed is a crucial enabler and getting your solution to market first is a clear advantage. GKN's additive manufacturing capabilities are allowing us and our partners to develop products more rapidly without need for product specific molding tools.

Auxilliary Processing Operations



Optional Auxiliary Operations - Examples

Turned inner cone

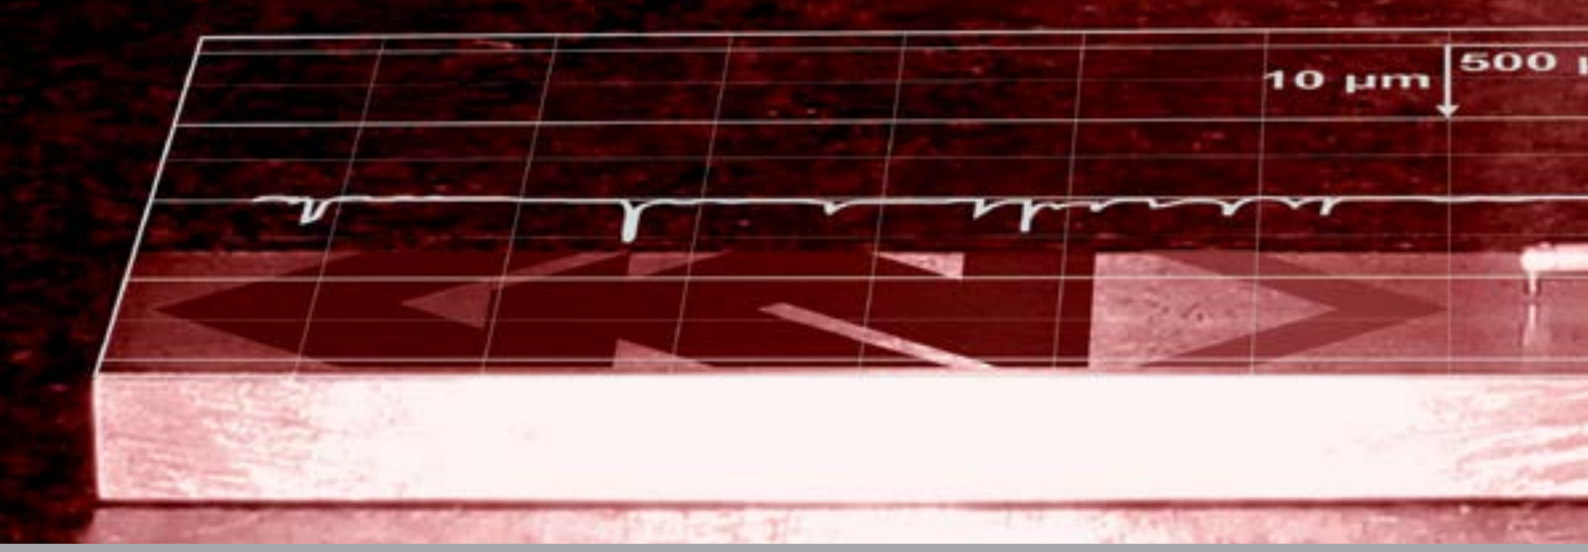
Turned outer diam-
eter

Surface densification
by rolling process

Ground surface

Induction hardened
teeth

Organic coated sur-
face



Surface Roughness Quality of PM Components

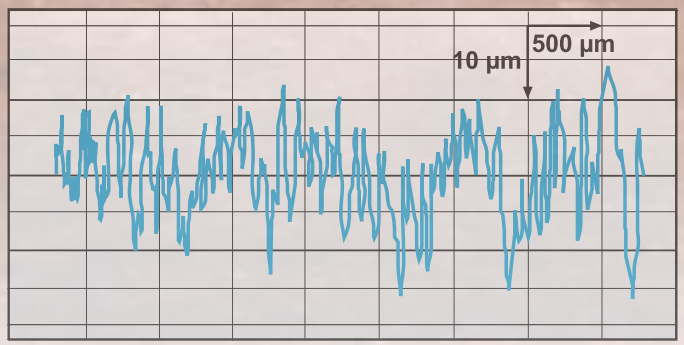
It is important to know that the surface structure of sintered components depends on the density but offers an enhanced contact aera compared to machined surfaces. Especially when sintered parts surfaces have been sized they are superior even to grinded surfaces offering best performance in form and function.

Today surface qualities on sintered parts are often still defined by R_t, R_a or R_z using values that seem to be based on experiences with machined surface qualities on non porous materials.

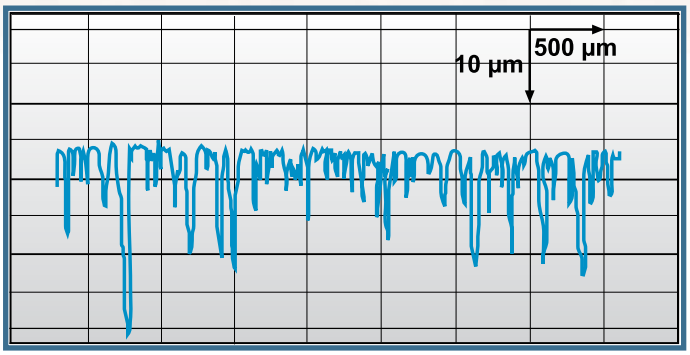
Due to the special (porous) structure of PM components the surface measurement with current measuring devices according to DIN EN ISO 4287 und 4288 is misleading and does not reflect the high quality of sintered surfaces. Hence deep pores may create extremely high R_t values even though the surface is plateau like and thus contains extraordinary well gliding properties.

By comparing profiles of surfaces from machined parts with porous PM components it becomes obvious that PM materials offer without doubt an improved surface smoothness although the P_t values from the compared St 50 vs. PM measurement plots are almost identical.

Due to the special surface properties of sintered parts it is therefore recommended to define roughness in R_{pk} and R_k (see DIN ISO 23519). The adjoining pictures and table 1 serve to illustrate this.



a) St 50 fine turned (P_t ~ 30)

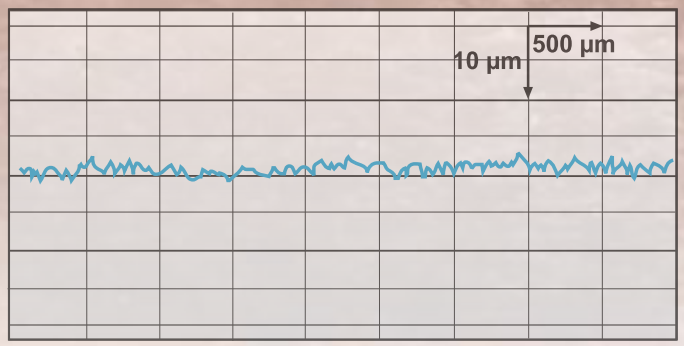


b) Sint-C 00 as sintered (P_t ~ 30)

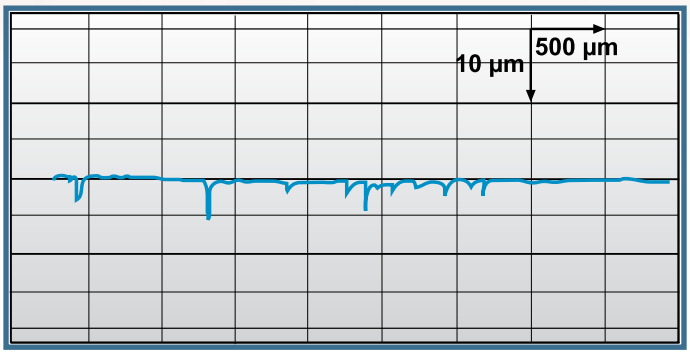
Figures a - d) Surface profiles of materials according to table 1

Figure	Processing Condition	Rough (repres	
		R_t	R_a
a)	St 50 fine turned	10.7	1.28
b)	Sintered (see graph b)	28	1.9
c)	St 50 grinded	4.2	0.6
d)	Sized (see graph d)	10.6	1.22

Table 1
Surface roughness measured on different processing conditions of steel and PM parts (examples)



c) St 50 grinded (P_t ~ 6)



d) Sint-C 00 sintered and sized (P_t ~ 6)

ness Values in µm entative examples)			Contact Area in % at Cutting Depth c		
R_z	R_{pk}	R_k	1 µm	2 µm	4 µm
8.2	4.5	5.4	< 1	6	12
18	1.4	1.4	< 1	56	72
